An Integrated Approach to Addressing Multiple SDG Challenges

Why I began thinking about this, and what I hope to solve.

Through my involvement with child-focused NGOs, I learned that water, nutrition, child labour, and access to education are closely interconnected challenges.

With the 2030 deadline for the SDGs approaching, many challenges still remain. Tackling them one by one may simply be too slow, so I began looking for a way to address several challenges at the same time.

I also focused on how climate change driven by CO_2 emissions from developed countries is having a significant impact on children and communities in developing countries.

How I would like to connect them.

The starting point of this idea was discovering a seawater desalination unit. By running it on renewable energy:

"**Renewable energy** → **water** → **water-saving technology** → **agroforestry** → **better livelihoods** → **reduced child labour** → **improved access to education** → **forest growth** → **CO_2 absorption**"

By connecting these elements into a single chain, I believe that even if it takes time, deploying the approach across many regions could help address multiple SDG challenges simultaneously, while also contributing to the water cycle through transpiration from forests and vegetation.

What I would like to ask the experts to look at.

I am not a specialist in this field, and this is not something I can realise alone, particularly in terms of funding, research and demonstration.

Regarding "01_An_Integrated_Approach_to_Addressing_Multiple_SDG_Challenges," published on GitHub,

I would be grateful for your comments and advice if any part of the idea could be useful or could lead to research or demonstration.
